

- I started by making the two tables Customers and Employees because those both have only primary keys and attributes.
- Then i created Movies and Concession inventory with only primary keys and attributes.
- I then created the Concession receipts and tickets tables that have the customer and employee ids.
- lastly I created a table in between concession receipts and inventory because of a many to many relationship.
- The customers and employees have a one to many relationship with tickets and concession receipts because the employees and customers can have multiple tickets and receipts but each ticket/receipt can only be associated to one employee and customer.
- The movies table has a one to many relationship with tickets because there can be only one movie on a ticket but multiple tickets can have the same movie.
